Tools Required for Installation

The following list of tools will be needed for proper installation of all components:

Safety Glasses
15/16" Open End Wrench (5/8" HEX NUT)
1-1/8" Box End Wrench (3/4" HEX HEAD BOLTS & NUTS)
15/16" Socket (5/8" HEX HEAD BOLT)
3/4" Socket (1/2" HEX NUTS)
Measuring Tape
Torque Wrench capable of 380 ft-lbs of torque

Recommended tools for installing the Hitch Ball:

None are required as the hitch ball comes from the factory pre-installed. It is recommended that you check the tightness of the hitch ball nut periodically using a 1-1/2" or 1-7/8" Thin walled socket depending on hitch ball size.

Torque Wrench capable of 360 ft-lbs of torque (always check ball manufacturer’s specifications for proper torque rating)

Definitions of terms: When a statement like “LEFT SIDE or RIGHT SIDE OF VEHICLE” is made, this always refers to the driver’s point of view, in other words, when the driver is sitting in the driver’s seat of the vehicle. Other terms used are DS which means DRIVERS SIDE and PS which means PASSENGER SIDE; this is irregardless of where you are positioned inside or outside of the vehicle.

Important!

Before installing or towing with this Bolt Together Weight Distributing Hitch please read and follow all instructions and warnings in the tow vehicle owners manual and trailer owners manual.

Have gross trailer weight and tongue weight checked before selecting and installing any weight distributing system.

Weigh trailer again after fully loaded and check loaded tongue and gross weight to ensure proper weight distribution hitch is being used.

CAUTION!

This kit is to ONLY be used with Husky weight distribution spring bars only that are designed for this particular system. Do not substitute with any other spring bars.

Warning!

Do not use a separate friction sway control on this unit!
Measure Trailer Coupler & Frame Height

NOTE: Changing the weight of the trailer and/or tow vehicle by adding, moving or unloading cargo may require the need to adjust how the weight distribution system is set up.

IMPORTANT! Set parking brake of tow vehicle and chock the wheels of the trailer before lifting or lowering!

1. Line up the tow vehicle and trailer on level pavement, in a straight position.

2. Use the trailer tongue jack to level the trailer. Measure the distance from pavement to the inside of the coupler socket and record here: ________________.

3. Mark a spot on the frame of the trailer as close to the coupler as you can, measure from this mark to the ground/pavement and record here: _________________. This measurement will be used later to determine if a proper setup has been achieved.
Determine the “Target” Uncoupled Ball Height for Tow Vehicle

4. Tow vehicle uncoupled ball height should be set no less than 1” higher than coupler height measured in Step 2, to allow for vehicle squat when coupled to trailer. Add 1” to the measurement from step 2 and record here: _______________.

Measure the Tow Vehicle

For vehicles with air springs, air shocks or automatic leveling systems only: Check vehicle owners manual or other instructions on these items. Unless otherwise indicated, air springs and air shocks should be deflated to their **minimum recommended pressure** before assembling and adjusting the weight distribution hitch. Pick reference points at the top center of the front and rear fender well of towing vehicle. Measure and record height to pavement here.

FRONT FENDER TO PAVEMENT: __________________________
REAR FENDER TO PAVEMENT: ________________________

Installation and Setup

NOTE: To obtain proper ball height on low ground clearance tow vehicles, shank may be oriented in the "UP POSTION" as shown in Illustration 4. If shank is used in the “DOWN POSITION, check shank for adequate ground clearance. Accessory shanks with greater height and length are available from your dealer. **IMPORTANT! Proper adjustment requires the use of the proper length shank; proper head height and proper head tilt adjustment.**
1. Insert the shank into the receiver box. Subtract 8 inches from the final ball height dimension shown in step 4 and measure from the ground and find the nearest hole in the shank. This will help you determine if you will have the shank Upright or Inverted. This hole will be the bottom 3/4” bolt mounting on the channel.

2. Un-screw the 5/8-11 hex bolt until the tip of the bolt threads is flush to the inside of the channel.
3. Hold CL TS head assembly onto shank as shown and align the bottom hole on the channel to the 2nd hole from bottom on the shank and insert a 3/4" hex head bolt. Remember the hole and orientation in these instructions are an example only, yours may be different.

Place a 3/4" ID washer onto the 3/4" hex bolt first.

4. As a starting point add 3 hardened washers marked with "F436" on to the large head pin and then insert into the welded bushing on the inside top of the channel.

3 Hardened washers and large head
5. Using the 15/16” socket, screw in the 5/8 hex bolt until all the rotational clearance in the CL TS head is taken up and the large head pin is bearing against the shank. Then turn an additional 1/4 to 1/2 turn.

6. Place a conical toothed washer on to a 3/4” hex bolt and then insert it through the slot in the channel.
7. The use of shims may be required to fill up the gap between the ears of the bottom plate weldment and the U channel. It is NOT necessary to have equal shims on either side.

8. Tighten 5/8 hex jam nut securely.

10. Insert a spring bar with the rating stamp facing up into the trunnion. Secure with the “D” retaining pin.
11. Swing wire “D” under trunnion and over the end of the pin. Repeat steps 9 and 10 for the other side.

12. Your CL TS system should look like this now.
Installing Frame Brackets

13. Install frame bracket 28.5”-30.5” from center of ball socket on coupler.

28.5”-30.5”
14. Loosen the 5/8” dog point screws so the lift bracket can be removed from the frame bracket. Use the 1/2” carriage head bolt, flat washer, lock washer and hex nut to hold the frame brackets in place. The bottom carriage head bolt should be in the hole closest to the underside of the frame.

The frame and lift brackets can be mounted on either the driver side or passenger side of the trailer and MUST be mounted to the trailer frame as shown. DO NOT mount the frame brackets to the inside of the frame!
15. Before hooking up the trailer to the hitch ball, adjust the height of the lift bracket so that the measured distance from the ground to the bottom of the trunnion is the same (approximately) from the ground to the top surface of the lift bracket. (Dimension “A” = Dimension “B” ±1 hole) this is a starting point and you may need to make adjustments later. Using a 12 point 3/4” socket, tighten the (4) dog point set screws 45-55 ft.-lbs.

16. Back up the tow vehicle and align the hitch ball so that it is directly under the coupler socket (use a spotter if you have one. CAUTION! Spotter should never stand between trailer and tow vehicle during connecting). Then, lower the trailer until the hitch is supporting some of the trailer tongue weight. The tow vehicle and trailer must be as straight and inline as possible.

17. Ensure the hitch ball is completely inside the coupler socket and close the coupler ball latch if it is not yet closed. Install coupler lock or pin for safety.

18. Raise the front of the trailer and rear of the tow vehicle until the tips of the spring bars are about level/even with the support surface of the loading brackets.
Spring bar loading on lift brackets

19. To load the spring bar onto the lift bracket, orient the lift tool as shown below and come under the spring bar. Then, put the “finger” of the lift tool into the square hole on the lift bracket and using BOTH hands on the lift tool lift up firmly and the rotate and push the lift tool towards the trailer until the spring bar is resting completely on the lift bracket and off of the 2 pins. If it is too difficult to lift the spring bar, then raise the height of the trailer until the spring bar is closer or vertically to the spring bar support surface of the lift bracket.
20. Once the spring bar is resting securely on the lift bracket insert the “L” retaining pin into the square hole and secure with the hair pin clip.

**WARNING:** Keep clear of the pivot path of all moving parts when there is tension on the spring bar. Maintain control of the lift handle at all times when raising or lowering the spring bar. Be sure that the “L” pin and hair pin is in place before driving.

**Check Vehicle Height and Adjust Spring Bars If Necessary**

21. Retract the tongue jack completely so the hitch is supporting the weight of the trailer. Measure the same 3 places as done on pages 4 & 5 and compare. The tow vehicle should settle evenly front to back. The rear fender should not settle lower than the front fender, if it has then you will need to either raise the lift brackets 1 hole or add a hardened washer under the large head tilt pin on the head assembly. The frame mark should be ¼”-1” max higher than the original measurement noted on page 4, section 3.
Properly Adjusted System

Over Adjusted System

Under Adjusted System

Removing the spring bar from the lift bracket

22. Make sure the tow vehicle and the trailer are on level ground and are straight. Chock the trailer wheels, and engage the emergency brake on the tow vehicle.

23. Raise the trailer tongue sufficient to ease the force required to lift the spring bar ends off of the lift brackets. Place the lift tool on the round peg and under the end of the spring bar as shown. And start pushing down on the lift tool.
24. Continue pushing down on the lift tool until it starts to come up and towards you.

25. There will be a point where the spring bar will stop and come to a rest on top of the 2 round pins on the lift bracket. Stop there and keep your hands away from the spring bar.
26. Remove the lift tool from under the spring bar and position it as shown below. Place the tip of the tool against the side of the frame, somewhere on the frame bracket or even on the lift bracket is fine. Then pull out on the handle (keeping hands away from the spring bar) until the spring bar falls off the lift bracket completely.

Towing Tips

Driving Tow Vehicle
Good habits for normal driving need extra emphasis when towing a trailer. The additional weight of the trailer affects acceleration and braking. Extra time should be allowed for passing, stopping and changing lanes. Signal well in advance of a maneuver to let other drivers know your intentions. Severe bumps and badly undulating roads can damage your towing vehicle, hitch and trailer, and should be negotiated at a slow, steady speed. If any part of your towing system “bottoms out” or if you suspect damage may have occurred in any other way, pull over and make a thorough inspection. Correct any problems before resuming travel.

Turning and backing up present new problems-plan ahead. It is highly recommended that a spotter be used when backing up to alert the driver of possible obstacles and prevent jack knifing the trailer.

Towing a trailer will change your turning radius, the longer the trailer the larger radius turn.

Driving Conditions
When driving in conditions where the pavement is wet, icy, snowy, loose gravel, grass and dirt, reduce speed and do not make any sudden maneuvers. Allow ample distance/time for stopping and changing lanes. If possible, wait for road conditions to improve before driving.

Follow all state, local and provincial driving and towing laws in the location you are driving in.

Not following your tow vehicle, trailer, and Husky instructions/manuals can result in a fatal accident.

Sway Control
The CL TS system has an integrated sway control feature; do not add a secondary sway control.

Check Your Equipment
Please refer to the MAINTENANCE section. Periodically check the condition of all your towing equipment and keep it in top condition.

Trailer Loading
Proper trailer loading is very important. Heavy items should be placed close to the floor near the trailer axle centerline. The load should be balanced side to side and firmly secured in the trailer to prevent shifting. Tongue weight should be 10-15% of the gross trailer weight for most trailers. Too low a tongue weight often produces tendency to sway.

Tire Inflation
Unless specified otherwise by the towing vehicle or trailer manufacturer, tires should be inflated to their manufacturer’s towing recommendations.

Towing Vehicle and Trailer Manufacturers Recommendations
Review the owner’s manual for your towing vehicle and trailer for specific recommendations, capacities and requirements.

Passengers in Trailers
Trailers should not be occupied while being towed. Most states enforce this regulation.
Trailer Lights, Turn Signals, Electric Brakes
Always hook up all of the trailer lights, electric brakes and break-away switch connection whenever trailer is being towed. Also periodically check functionality of all lights before towing and repair any problems as needed.

Remove Hitch When Not Towing
Remove hitch from receiver on towing vehicle when not towing a trailer to reduce chances of striking hitch on driveway or other objects, and reduce the chance of parts being stolen.

Modifications
Do not adapt or modify the Bolt Together Weight Distribution System in any way.

Safety Chains
Can Prevent Runaway Trailer in case hitch/coupler fails.

1. Always use safety chains when towing.
2. Cross safety chains under coupling to prevent tongue from dropping to ground.
3. Allow only enough slack for tight turns.
4. Do not let safety chains drag on ground.
5. Twist safety chains equally from hook ends to take up slack.
6. Use safety chains rated equal to or greater than twice the maximum gross trailer weight rating.

Uncontrolled tilting of trailer can result in personal injury or equipment damage.
1. Distribute weight so that trailer tongue weight is approximately 10-15% of the gross trailer weight.

Incorrect tongue weight can cause fishtailing and loss of control of towing vehicle resulting in serious injury and equipment damage.
2. Tongue weight is the amount of trailer weight that rests on the towing vehicle hitch – that is, the downward pressure on the coupler.
3. Remove or adjust trailer load to get correct tongue weight.
4. Do not let tongue weight exceed coupler and hitch rating.
5. Use slower speeds when towing a trailer.
Maintenance

Keep hitch parts painted to prevent rust and maintain good appearance. Do not remove or paint over labels.

Keep lift brackets clean, and using a light lubrication on the lift bracket support surfaces to keep rust to a minimum is acceptable.

At The Beginning of Every Towing Day:

- Clean ball and coupler socket and coat ball lightly with grease.
- Ensure the “L” pins are secured in place on the lift brackets
- Ensure the “D” pins are securing the spring bars in the trunnions by giving the spring bars a tug before lifting into the lift brackets.
- Check that the hitch pin is in place and secure.
- Check frame bracket bolts are tight.
- Ensure the coupler latch is closed and locked with a pin.
- If electric brakes are used ensure the emergency break away cable is attached to the tow vehicle.
- Check to see that all electrical hook-ups are in working order and that the safety chains are securely connected.
- Towing safely is the responsibility of the driver of the vehicle. Failure to tow safely can result in vehicle damage, bodily injury or death.
- The 3/4” trunnion hex bolts come lubricated from the factory re-lubricate if needed with bearing/axle grease. Do not apply lubrication to the friction surfaces of the top and bottom plates or on the top or bottom trunnion surfaces as this will reduce the built in friction sway feature.

After 500 miles:

- Inspect all hardware for severe wear, replace and/or torque to factory specifications when needed.
- Check the tightness of the 3/4” trunnion hex bolts with a torque wrench. The torque is 150 ft. lbs.
- Inspect hitch ball for severe wear and ensure the hitch ball nut is torqued properly.
- Check to see that all shank bolts are properly tightened (380 ft. lbs.)
- Inspect spring bars for severe wear and there is no noticeable damage.
- If in doubt as to whether or not wear is beyond a safe limit always call the Husky Tow Technical support line and discuss with a trained technical advisor.

Check All Trailer to Towing Vehicle Connections for Security and Operation

NOTE: Surge brakes usually require a small amount of fore and aft movement for their actuating mechanism to function. Tighten the two ¾” bolts to 380 ft. lbs. torque once the head angle is set.

Those surge brake actuators not designed for use with a weight distributing hitch may bind and not operate freely. Check your surge brake operating instructions for any specific requirements regarding their use with weight distributing hitches.

Warnings

Loaded ball height should never be greater than what these instructions allow! Front wheel overload and loss of rear wheel traction can result and can lead to unstable handling. It can reduce braking ability and create a tendency to “jackknife” when turning and braking at the same time.

Loss of steering may result in a “high nose” trailer setup. If this occurs refer to page 10 “CHECK VEHICLE HEIGHT AND ADJUST SPRING BARS IF NECESSARY” and make the necessary equipment adjustment or tow vehicle and/or trailer load adjustments.
Short wheel base vehicles may induce sway when towing a trailer. **USE EXTREME CAUTION.**

**Caution:**

**FRONT WHEEL DRIVE VEHICLES:**
Do not attempt to hook-up or tow with the rear tires of the towing vehicle removed. Severe structural damage to the towing vehicle, hitch and trailer may result. A towing vehicle/trailer combination cannot be controlled adequately unless the towing vehicle’s rear wheels are carrying their share of the load.

**CAUTION!**
Using the Bolt Together Weight Distribution System without the spring bars removes all weight distribution functionality of the product.
Warranty Terms:

Life Time Limited Warranty:

This warranty applies solely to Husky Weight Distributing Hitch manufactured by DTS Manufacturing for Husky Towing Products.

DTS Manufacturing, Husky Towing Products and Coast Distribution make no guarantees or warranties for products not manufactured by DTS Manufacturing. Such products are covered solely under any applicable warranty of the manufacturer. It is always recommended that the operating instructions and guarantee instructions provided by the manufacturer are followed.

DTS Manufacturing warrants its products to be free from manufacturing and material defects to the original purchaser for the length of warranty stated above from the date of retail purchase. If any products are found to have a manufacturing or material defect, the product will be replaced or repaired at the option of DTS Manufacturing, Husky Towing Products and Coast Distribution with proof of purchase by the original purchaser. The original purchaser shall pay all transportation and shipping costs associated with the return of the defective product and the defective product shall become the property of DTS Manufacturing.

The Warranty applies to DTS manufactured products used for individual and recreational purposes. Commercial usage of the DTS manufactured products limits the warranty to 90-days from date of purchase.

The Warranty applies only to DTS manufactured products which are found to be defective in manufacturing or material. This warranty does not apply to normal wear and tear of to the finished placed on DTS manufactured products.

DTS Manufacturing, Husky Towing Products and Coast Distribution are not responsible for any labor costs incurred for removal or replacement of the defective product.

DTS Manufacturing, Husky Towing Products and Coast Distribution are not responsible for repair or replacement of any product under the limited warranty where the product was improperly installed, misapplied, altered, abused, neglected, overloaded, misused or damaged as a result of an accident, including any use of the product not in accordance with all product operating and safety instructions.

Without limiting the generality of the foregoing, DTS Manufacturing, Husky Towing Products and Coast Distribution shall under no circumstances be liable for any incidental or consequential loss or damage whatsoever arising out of, or in any way relating to any such breach of warranty or claimed defect in, or non-performance of the products. Some states do not allow the exclusion or limitation of incidental or consequential damages, so the above exclusion or limitation may not apply to you.

This limited warranty gives you specific legal rights, and you may also have other rights that vary from state to state.
